CONTENTS

1. Precautions

Warning : Please abide by the following precautions in order to conduct the maintenance procedures in a safety fashion.

1-1. Caution when you replacing compressor.
- Do not smoke. Remove all the possible ignition sources and then replace compressor in well-aired places.
  - Don't use welding machines if R600a refrigerant does not exposed.
  - In the case of gas leakage, always open the windows.
  - When cutting the SUCTION, DISCHARGE pipe of the compressor, always take caution of the inner pressure of the remaining gas.

1-2. Take out the power plug
- Always take out the power plug from the outlet when doing repairs.

1-3. Be careful of electric shocks
- When inspecting the circuit, don't touch the battery charger and be careful of electric shocks.

1-4. Use proper components
- Always use the component labeled in the service component chart when replacing components for repairs.

1-5. Use proper tools
- Always use proper tools for repairs. If worn out tools are used, it would cause defects in tuning and electrical contact, leading to accidents.

1-6.
When doing repairs, inspect the **POWER CORD** or whether there is fire in the lead wire and make sure they are replaced.

1-7. Cutting of LEAD-WIRE
- For connecting the lead-wire that has been cut off, use soldering or connector and always disconnect the vinyl tapes.

1-8. Check for disconnection
- After completing the assembly, always measure the disconnection resistance level, and turn on the power after checking it is above 1MΩ.

1-9. Earth
- Check the status of earthing and repair the incomplete ones.

1-10. Be careful of children
- There is always the possibility of danger when doing repairs so make sure that children can't come nearby.

Cleaning : After completing repairs, clean the surrounding area and the refrigerator and tell the consumer about the repairs being made.

This appliance contains a small amount of the refrigerant isobutane(R600a), a natural gas with high environmental compatibility but which is also combustible. When transporting and installing the appliance, care should be taken to ensure that no parts of the refrigerating circuit are damaged. Refrigerant squirting out of the pipes could ignite or cause an eye injury. If damage occurs nevertheless, avoid any flames or potential sources of ignition, and air the room in which the appliance is standing for several minutes.
- In order to avoid the creation of a flammable gas-air mixture if a leak in the refrigerating circuit occurs, the size of the room in which the appliance may be sited depends upon the amount of refrigerant used. The room must be 1m³ in size for every 8 g of refrigerant R600a inside the appliance. The amount of refrigerant contained in your particular appliance is shown on the identification plate inside the appliance.
- Never start up an appliance showing any signs damage. If in doubt, consult your dealer.

⃠	Refers to prohibition.
	Refers to prohibition of dismantling.
	Refers to prohibition of contact.
❗	Refers to guidelines which have to be followed.
	Refers to detaching the power plug from the outlet.
	Refers to earth connection for preventing electric shocks.

⚠ **Warning**	Refers to possibility of death or serious injury of a person.
⚠ **Caution**	Refers to possibility of injury of a person or damage to property.

2. Product Specifications

Model		SR-L629EV	SR-L679EV	SR-L627EV	SR-677EV
Type		LMF 2 Door

5-5. Temperature Control and Other Capacity Explanation

1. Display design

2. Temperature control function
 1) Temperature selection of freezer compartment
 ❋ After the initial key selection, it displays the notch which is presently set up, then within 5
  seconds re-memorize the key after 1-2) points mentioned below. If there is no input of the
  key, it moves back to the previous temperature display.
  1-1) From -14°C ~ -25°C, each one key is selected in 1°C interval.
  1-2) Selection key operation for Freezer is set up orderly.
  1-3) Actual temperature is indicated during both Power-On and electrical failure.
 1-4) Standard temperature of each stage is as follows.(standard for 1/3 height)

Stage	1	2	3	4	5	6	7	8	9	10	11	12
Temperature	-14°C	-15°C	-16°C	-17°C	-18°C	-19°C	-20°C	-21°C	-22°C	-23°C	-24°C	-25°C

  1-5) After key input, seven-segment indication changes immediately but actual function
    operates after 10seconds.

 2) Temperature selection of refrigerator compartment
  2-1) From 7°C ~ 1°C, each one key is selected in 1°C interval.
  2-2) After the initial key selection, the former selected temperature is displayed, and within
    5seconds temperature selection alters as in 2-3), and when final key input is done, the
    final key input temperature converse into a set point after 10 seconds.
  2-3) Set up is established orderly according to operation of selection button.
  2-4) Actual temperature is indicated during both Power-On and electrical failure.
  2-5) Standard temperature of each stage is as follows.(standard for 1/3 height)

Stage	1	2	3	4	5	6	7
Temperature	7°C	6°C	5°C	4°C	3°C	2°C	1°C

  2-6) After key input seven-segment indication changes immediately but actual function
    operates after 10seconds.

3) Quick freeze
  3-1) Press the on/off buttons of Quick Freeze so that the lamp of Quick Freeze is light up and off and then it operates it's function automatically.
  3-2) It does not indicate from initial Power on.

Change of light indication	Initial Power On	Pressed once time	Pressed second time	Remark
	➤ Off ----➤	Quick Freeze On	------➤ Off	

    a) When Quick Freeze is selected, LED indication will immediately change but actual operation operates after 10 seconds. (COMP and FAN operates continuously for 2 hours and 30 minutes and it switches off automatically.)
    b) When Quick Freeze is selected, it will operate unconditionally without considering the temperature of freezer compartment.
    c) During the operation, the temperature of refrigerator compartment is controlled automatically by the selected temperature.
    d) Temperature display of freezer displays actual temperature.

4) Quick cool.
  4-1) Press the on/off buttons of Quick Cool so that the lamp of Quick Cool is light up and off then it operates its function automatically.
  4-2) It does not indicate from initial Power on.

Change of light indication	Inition Power On	Pressed Once time	Pressed second time	Remark
	➤ Off ----➤	Quick Cool On	-----➤ Off	

    a) When Quick Cool is selected, LED indication will immediately change but actual operation operates after 10 seconds.
    b) When Quick Cool is selected, COMP and R-Fan are operate until the temperature of refrigerator compartment reached -2°C but the maximum operation time of Quick Cool is 2 hours and 30 minutes. So that, it switches off automatically after 2 hours and 30 minutes.
    c) During the operation, the temperature of freezer compartment is controlled automatically by the selected temperature.
    d) Temperature display of refrigerator displays actual temperature.

❋ If you press Quick Freeze and Quick Cool button concurrently, each function operates independently.

Reference

If you choose Quick Freeze or Quick Cool when freezer temperature is more than -10°C and refrigerator temperature is above +10°C just as the initial Power On Condition, it operates differently from what is mentioned above, and this is an exceptional case.

5) Sabbath function
    5-1) It will turn to sabbath function if you press freezer and refrigerator temperatune button together for 5 seconds.
    5-2) When turned to sabbath function, all of the front display of LED turn off.
    5-3) The light will not switch on even when the door is opened, and if it was switched on then it will switch off.
    5-4) To cancel the operation, you have to press freezer and refrigerator temperature button together again for 5 seconds.
※ This function is used only in special area.

3. Buzzer alarm function
 1) Touch button type (ding-dong sound)
    1-1) there is "ding-dong" sound to confirm input periodically for each one second for button operation in each control panel.
    1-2) key recognition is within 0.2 sec and "ding" sound beeps in continuous key recognition.
    1-3) key recognition sound will first activate in other information.

2. Alarm when door is open
    2-1)Alarm melody will run if door of freezer or refrigerator is open for 2 minutes or more.
    2-2) If door continue to remain open alarm will run periodically.
    2-3) Alarm will immediately stop when door is closed.

3. Forced running alarm and forced defrost alarm (beep sound).
    3-1) If forced running, or defrost is chosen, there is a beep sound.
    3-2) Once you press forced running test button, it will beep until you choose cancellation or it cancel automatically (0.25sec ON/0.75sec OFF)
    3-3) It will beep even during defrost is complete (include paused time) or until cancel button is pressed.
    3-4) During forced running alarm runs 0.1sec on and 1sec off, and during forced defrost alarm runs as well 0.5sec on and 0.5sec off.

4. Defrost function
 1) Once power is on and COMP is ON for 4 hours, both refrigerator and freezer starts to defrost at the same time.
 2) When the defrost time is reached, F-Fan and COMP runs pre-cooling for 20 minutes and starts heating activity then the pause time is operated about 8 ~12 minutes(10±2minutes).
 3) Actual defrost period is from minimum 6 hours up to maximum 11 hours, and freezer compartment defrost period is from min. 12 hours up to max. 22 hours instantaneously (COMP ON for additional period).
 4) The decision of defrost period is maded by the ambient temperature and the count of door open and the length of door open time.
 5) Defrost periods memorize these information at MICOM as a case per hour. Therefore, case of defrost period distinguishes per hour.
 6) Influences of count and length of door open for time distinguisher get checked from the door switchs of refrigerator compartment and freezer compartment.
 7) If refrigerator compartment temperature is over trset‑on+6°C (at ambient temp. is over 21°C) or trset‑on+2°C (at ambient temp is over 33°C), COMP is runned by refrigerator compartrment temperature. In this case, the defrost heater of refrigerator compartment starts after 2 hours running of COMP.
 8) After 7) is proceeded, the concurrent defrosting of freezer and refrigerator start after 4 hours 4 hours running of COMP.
 9) If defrost operation is reached during quick freeze operation, quick freezer operation is finished first and then defrost operation is proceeded.

5. Test function
  ※ Test function is for the test of PCB, product, official inspection and ability of SVC.
  ※ When s/w test is chosen and tested the product, you switch off and on again then let it run a self-test.
  1) Function of forced running.
      1-1) If you choose PCB button once, COMP will automatically start.
      1-2) When forced running is chosen, freezer will show "FF" and "1" in refrigerator automatically. when this option is selected and 1 minute is past, temperature memorized will not change even if you select defrost or cancel test activation (maintains F:-25°C and R:1°C).
      1-3) Forced running will activate only for 24 hours in full-down operation. Freezer and refrigerator will automatically activate.
      1-4) To cancel forced running power is off and on again or select test cancel mode.
      1-5) During forced running alarm (0.25sec ON/ 0.75 sec OFF) runs until it is completed. The alarm will continue without alarm key selection.
      1-6) When forced running is selected, quick freeze operation does not activate.
  2) Forced defrost function
      2-1) When you press test button once more during forced running refrigerator compartment activates defrost.(R-defrost only)
      2-2) If you press button once more, freezer defrost will start at the same time with refrigerator.
      2-3) If forced defrost function is selected, forced running will automatically cancel. And after forced defrost is completed, it will proceed normal operation.
  3) Test cancel mode
      3-1) When you press test button once more during forced defrost in freezer and refrigerator, it proceeds normal operation.
      3-2) Alarm will stop during test cancel mode.

6. Function of initial Power ON
  1) When power ON, refrigerator proceed initial self-test and, if normal, it indicate LED in all operation panel for 2 seconds.
  2) When proceeding self-test and if temperature sensor finds fault sensor, LED displays the relatecl LED(see table 1.) for periods of 0.5 sec of related LED.
  3) Switch on all LED for 2 sec. Initial display of freezer and refriger show actual temperature.
  4) Keep condition of R-defrost heater and F-defrost heater for 3 sec for interval of 0.5 sec.
  5) If F and R- defrost is finished at initial condition, COMP, F-fan and R-fan activates intervals with 0.5 sec without inner temperature condition.

7. Power failure compensating function
  1) function of notch save.
      1-1) When you press quick freeze, quick cool, freezer, refrigerator button, micom save present operating and display condition. Once the power is re-instated, the appliance will continue to operate at the most recent temperature setting (except test mode.)
      1-2) 1-1) Activity proceeds when F-evap. and R-evap. Temperature is below 10°C added together at initial power ON, it will activate, and if its more than 10°C it goes back to initial mode activity. Quick freeze, quick cool and Sabbath function get not selected.
      1-3) If power gets off during quick freeze, quick cool or sabbath function and then the power is re-instated, the appliance will proceed quick freeze or quick cool function again at least one of F-evap. or R-evap. temperature is below 10°C.

✻ Exhibition mode

1. When you press quick freeze button and freezer temp. button together the operation changes into exhibition mode.
2. In exhibition mode, compressor is immediately off and defrost do not activate.
3. If you press quick freeze button and freezer temp. button together for 5 sec exhibition mode cancel out and bact to nomal operation.

8. Self-test function
 1) Define of the fault temperature sensor : temperature of the sensor is over between -50°C (4.5volt) ~ +50°C(0.5volt)
  1-1) Self-test fuction due to power ON.
    a) When a power is ON, it internal MICOM will decide faulty in temperature within 1 sec.
    b) If faulty sensor is found, the "related display LED" switches on and off for 0.5 sec intervals. And it will not beep (refer to self-test faulty indication table).
    c) At the LED situation is the faulty sensor display, self-test function key (press quick freezer and quick cool button for 5 sec) is the control of normal temperature is delayed.
    d) Fixing default sensor when there is an error, or press quick freeze and quick cool button for 5 sec., it automatically cancel and activate normally.
 2) Self-test function during normal activation
    a) During normal activation, if you press quick freeze and quick cool key together for 3 sec. temperature selection display of all ON/ OFF show for 2 sec by 0.5 intervals. Including this 2 sec, press quick freeze and quick cool button together for 5 sec then it select self-test function.
    b) If there is ding-dong sound it change into self-test function. If you press refrigerator temp. selection button during 2 sec display toggle, it proceeds as the display function of the presently operating parts.
    c) If there is an error of the sensor, display of the faulty sensor continue for 30 sec then activate normally (ding-dong alarm activates).
    d) Button selecting is not selected during self-test proceeding.

Table 1. Display table of self diagnosis.

No	Item	Display LED	Symptom	Remark
1	R-sensor	Refrigerator 5	• Open faulty • Short faulty	•Suspected to be below -50°C •Suspected to be over +50°C
2	R-area defroster sensor	Refrigerator d	• Open faulty • Short faulty	•Suspected to be below -50°C •Suspected to be over +50°C
3	Outer sensor	Freezer E 5	• Open faulty • Short faulty	•Suspected to be below -50°C •Suspected to be over +50°C
4	F-sensor	Freezer F 5	• Open faulty • Short faulty	•Suspected to be below -50°C •Suspected to be over +50°C
5	F-area defroster sensor	Freezer d 5	• Open faulty • Short faulty	•Suspected to be below -50°C •Suspected to be over +50°C

9. Display function of the presently operating parts.
  1) If you press quick freeze and quick cool button together for 3 sec during normal operation, LED display refrigerator and freezer temperature will show ON/OFF for 2 sec at interval of 0.5 sec

2) At this moment if you take off quick freeze and quick cool button and press refrigerator temp. button (ding-dong sound), it change into the display of the presently operating parts.

3) This display condition is unrelated to actual operation and it is an reference of indication that MICOM commanded operating order).

Table 2. Display table of the presently operating parts.

No	Content	Display LED	Operation	Remark
1	R-fan	1 st letter "a" led in refrigerator	Include R-fan activation	
2	R-defrost heater	1 st letter "c" led in refrigerator	Defrost heater activation	
3	Initial start mode	1 st letter "d" led in refrigerator	Initial power is switched ON	
4	Over load mode	1 st letter "e" led in refrigerator	Outer temperature is over 35°C	
5	Low temp.mode	1 st letter "f" led in refrigerator	Outer temperature is below 20°C	
6	Exhibition mode	1 st letter "g" led in refrigerator	Exhibition mode is operated together	Ref. 6.button scan and display circuitry (see page 21)
7	Comp	1 st letter "a" led in freezer	Led ON when COMP activation is included	
8	F-fan	1 st letter "b" led in freezer	Led ON F-fan activation is included	
9	F-defrost heater	1 st letter "d" led in freezer	Led ON when F-heater activation is included	
10	F-Lamp	1 st letter "a" led in freezer	Led ON when F-lamp activation is included	
11	R-Lamp	1 st letter "b" led in freezer	Led ON when R-lamp activation is included	
12	Normal mode	1 st letter "e", "f" led off in refrigerator	Out temperature is about 21°C~34°C	

10. Actual temperature and selected temperature in display function
 1) Initial power ON
    1-1) When initial power On is set, it reads both inner temperature of freezer and refrigerator. Display range of freezer is -35°C~+30°C and refrigerator -9°C~+9°C.
    1-2) After this, if freezer inner temperature of a trset_off+1°C above is recognized at least once, LED display of freezer will change into a set-up temperature. And if refrigerator inner temperature of trset_ off +3.5°C above is recognized at least once, LED display of refrigerator will change into a set-up temperatures. After all this, if freezer inner temperature is above 0°C and refrigerator inner temperature above +15°C it will proceed display blinking. But blinking operation only starts 10 minutes after it senses its problem with inner temperature.
    1-3) During the actual temp. dispaly condition, you choose quick freeze or quick cool function the LED display will display actual temperature.
 2) Stability in inner temperature
    2-1) After selected temp. is reached, freezer and refrigerator display the selected temp.
      a) If freezer inner temperature is above 0°C for 10 minute, the display of the selected temp. will blink.
      b) If refrigerator inner temperature is above 15°C for 10 minute, the display of the selected temp. will blink.
      c) When quick freeze is chosen, only freezer display will display actual temperature and the actual temperature displays up to -35°C.

3) Door open

when door is open, the related display shows an actual temperature.

3-1) Display range of freezer is -35°C ~ 30°C and refrigerator is -9°C~9°C.

3-2) If freezer inner temperature is above 0°C for 10 minute, the display of the selected temp. will blink.

3-3) If refrigerator inner temperature is above 15°C for 10 minute, the display of the selected temp. will blink.

3-4) When door is open, 1°C will increase after delay time from the display before door opens. When door close, 1°C will decrease after delay time if there is a change in inner temperature. Temperature will reach up to presently selected notch.

4) Defrost Display function

4-1) If defrost starts both freezer and refrigerator display the selected temperature. So it will not blink for 2 hours even if it sensed faulty in inner temperature, after 2 hours it will decide to blink or not.

Reference

State of COMP cooling fan according to the ambient temperature (When COMP. is re-started)
- always OFF COMP cooling fan when ambient temperature is below 5°C.
- COMP cooling fan always switch ON after 9 minute when ambient temperature is 6°C~10°C.
- COMP cooling fan always switch ON after 6 minute when ambient temperature is 11°C~15°C.
- COMP cooling fan always switch ON after 3 minute when ambient temperature is 16°C~21°C.
- COMP cooling fan always switch ON when ambient temperature is over 21°C.

6. Circuit Descriptions

6-1. Power circuit
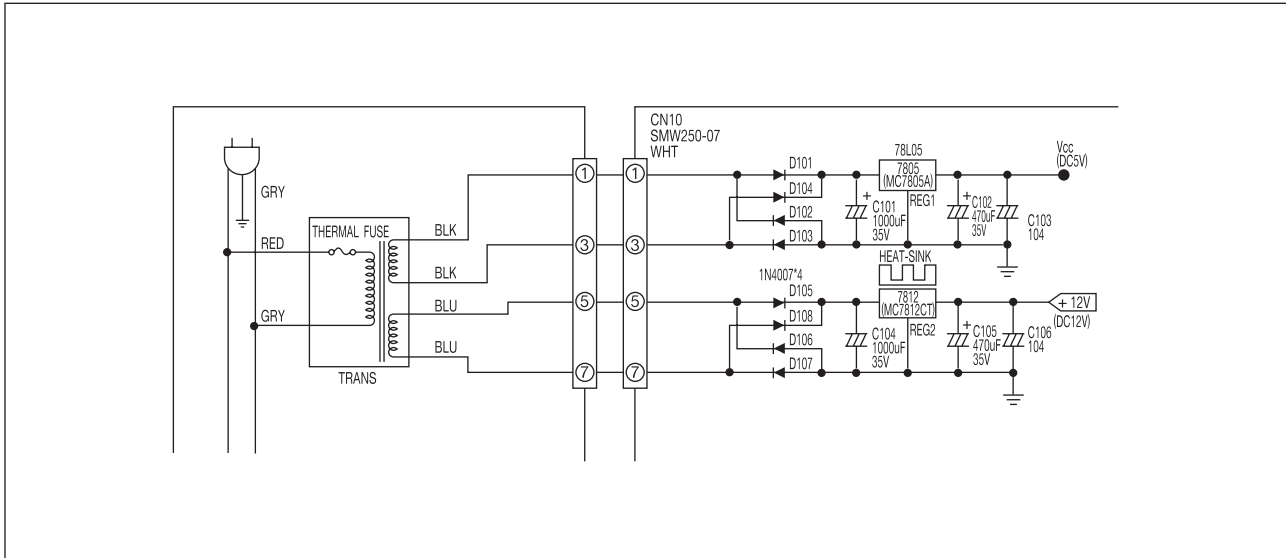

Voltage	Circuit used
+12 (DC 12V)	Relay Operation & LED Display
Vcc (DC 5V)	Power around MICOM & Sensor Detector

1) The input AC voltage of DC-trans secondary registers 8V at CN10 between ①～③. The rectified voltage passed through D101 ~ 104 becomes DC 5V through voltage regulator MC7805(REG1). The power(DC5V) is supplied to the power around micom and sensor detector.

2) The input AC Voltage of DC-trans secondary registers 15V at CN10 between ⑤～⑦. The rectified voltage passed throush D105 ~ D108 becomes DC 12V through voltage regulator MC7812CT (REG2). The power (DC12V) is supplied to the relay operation and LED display.

6-2. Oscillator
Port	Oscillating Frequency
Xin(#19)	4.00MHz
Xout(#20)	4.00MHz

±0.5% Error

It is designed for clock generation and time calculation for synchronizing transmission and reception on the logic elements inside the MICOM. If the X-TAL specification changes, MICOM may make an error.
(The standard components should be used.)

6-3. Reset Circuit
Port	Voltage
Vcc	5V
Reset	5V

When power is supplied to MICOM, reset circuit initializes RAM and other parts on MICOM to initialize all programs. Reset voltage maintains "low" for hundreds of μsec comparing to MICOM Vcc voltage when power is input. It also maintains "high"(5V) during normal operation. But, when Vcc drops to 3.4V-3.7V, reset port becomes "low".

6-4. Door S/W Detector

20
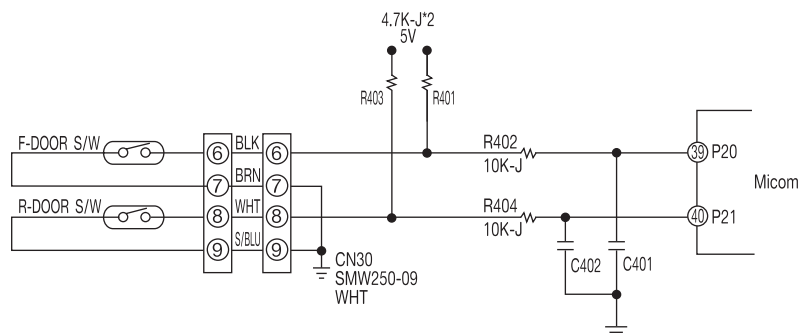

DOOR	Door Conditions	Door S/W Contact	MICOM PIN NO	Micom Input Voltage
F	CLOSE	OPEN	# 39	"HIGH"
	OPEN	CLOSE		"LOW"
R	CLOSE	OPEN	# 40	"HIGH"
	OPEN	CLOSE		"LOW"

1) If door is open, door S/W contact is closed. Then MICOM receives "low" signal and detects door open then, Relay control circuit receives "HIGH" signal and turn Lamp on.
2) If door is closed, door S/W contact is open. Then MICOM receives "high" signal and detects door close then, Relay control circuit receives "LOW" signal and turn Lamp off.

6-5. Temperature Sensor
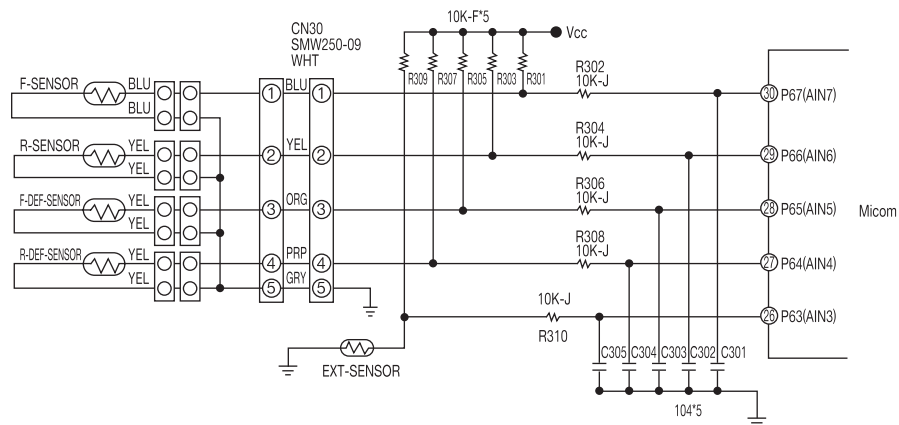

(Air Sensor)

When Sensor is open	When sensor is cut off
MICOM input "HIGH"	MICOM input "LOW"

1) The sensor uses the characteristics of thermistor. If temperature goes higher, resistance goes lower. On the contrary, if temperature goes lower, resistance goes higher.
2) MICOM input voltage is counted by sensor as follows.

$$V_F = \frac{R_{TH}}{R_{TH} + R_{301}} \times V_{CC}$$ (V$_{CC}$: 5V, R$_{TH}$: Sensor reisitance)

3) For the resistance information on temperature and MICOM input voltage, please refer the conversion table. (Page. 41)
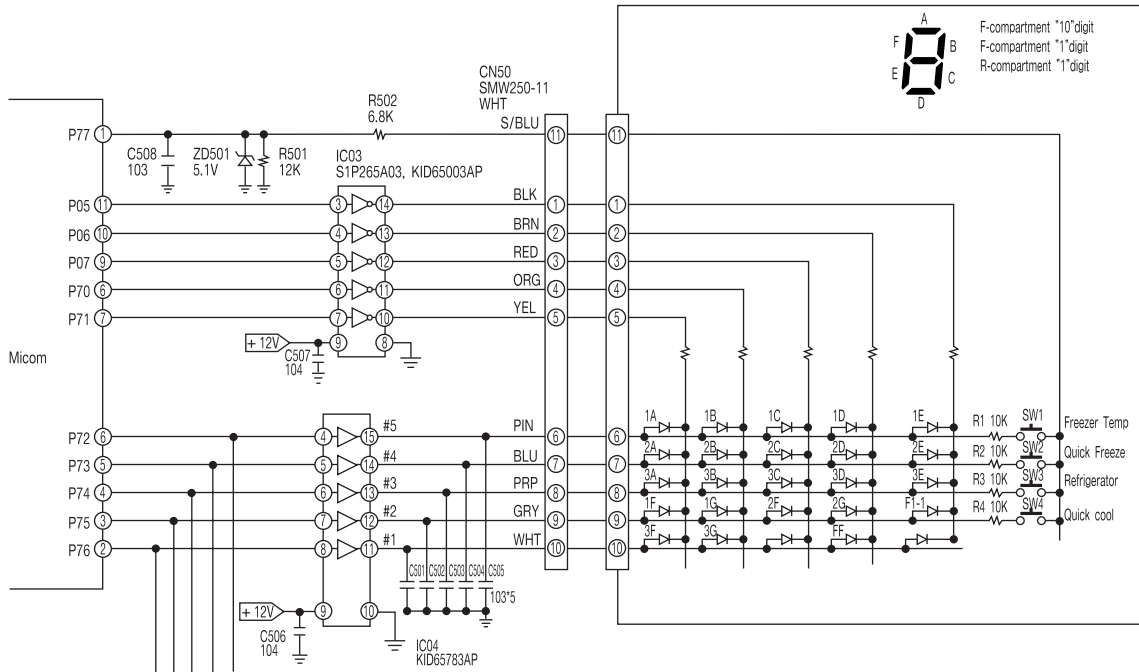

At that time, the peak to peak voltage of square signal registers around 12V. The grid #1 ~#5 waveforms are as follows.
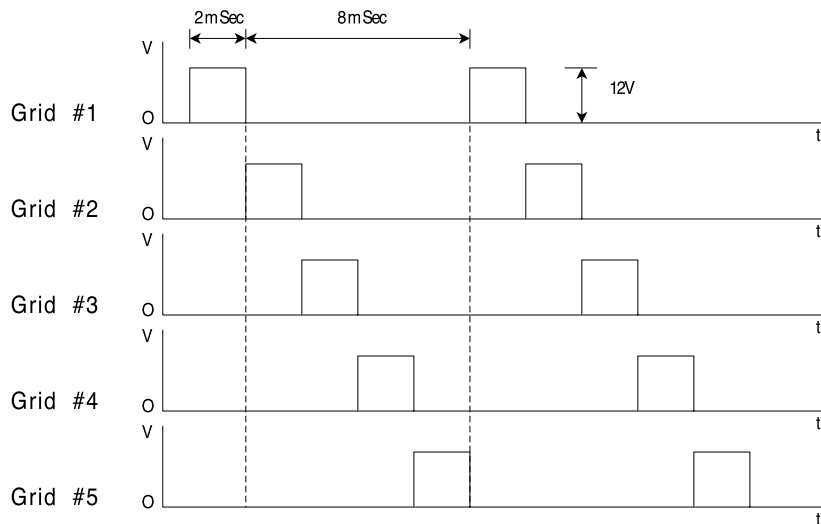

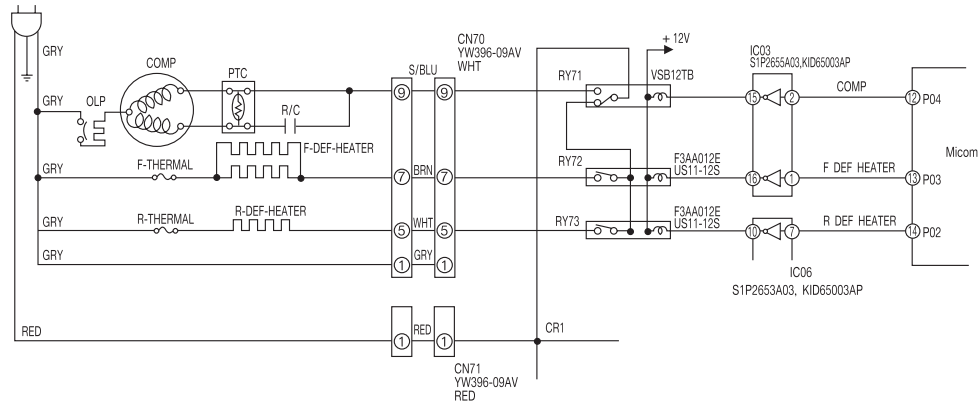

If MICOM outputs "high" signal to driver-IC(KID65003AP/S1P2655A∅3) according to each load operation conditions, IC turns on and DC 12V flows to ground through the relevant relay coil. Then, core is magnetized by the coil current, and relay contact switches on. When relay contact is on, AC POWER is supplied to the relevant operation load, then which will be activated. If MICOM outputs "low" signal, load operation stops with the relevant relay contact off.

RELAY		Load	Remark
COMP	Defrost Heater		
on	off	Comp Operation	Defrost-Heater Power Off
on	on	Comp off, Defrost-Heater Off	
off	on	Defrost-Heater On	Comp Power Off
off	off	Comp Off, Defrost-Heater Off	

Like the above block diagram, operation of F, R defrost heater is detervminedy according to the operation of relay for COMP. When comp relay is connected to NO terminal, comp operates. However, in case of F, R defrost heater, electricity dose not pass through the heater though relay works, But, if Comp relay is connected to NC terminal, comp does not operate and heater gets electrieity according to operation of F, R defrost relay.

6-8. Other option functions
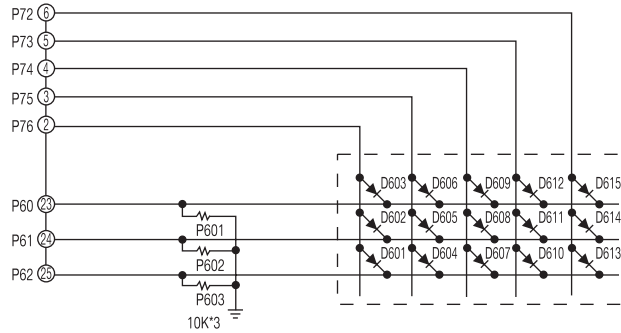

Temperature and function values are changeable by using main PCB switching diode.

- Note : If possible, do not change because the values have been set in factory. When changing option
functions, power should be turned off.
(Only initial power-on allows reading option function)

6-9. Option Table

NOTE

If possible, do not change because the values have been set in factory.
When changing option funcfions, power should be turned off.

4) When cooling fan do not activate

Check cooling fan when defrost activation is selected.

1. When COMP is OFF both freezer and refrigerator cooling fan plus COMP cooling fan remain OFF.

2 . When COMP is ON, refrigerator fan is not always ON and when refrigerator temperature reached to a set-up temperature fan goes OFF.

3. When both freezer and refrigerator door close from open each fan takes delay time (5sec~ 1 min) and running. (COMP ON as a condition)
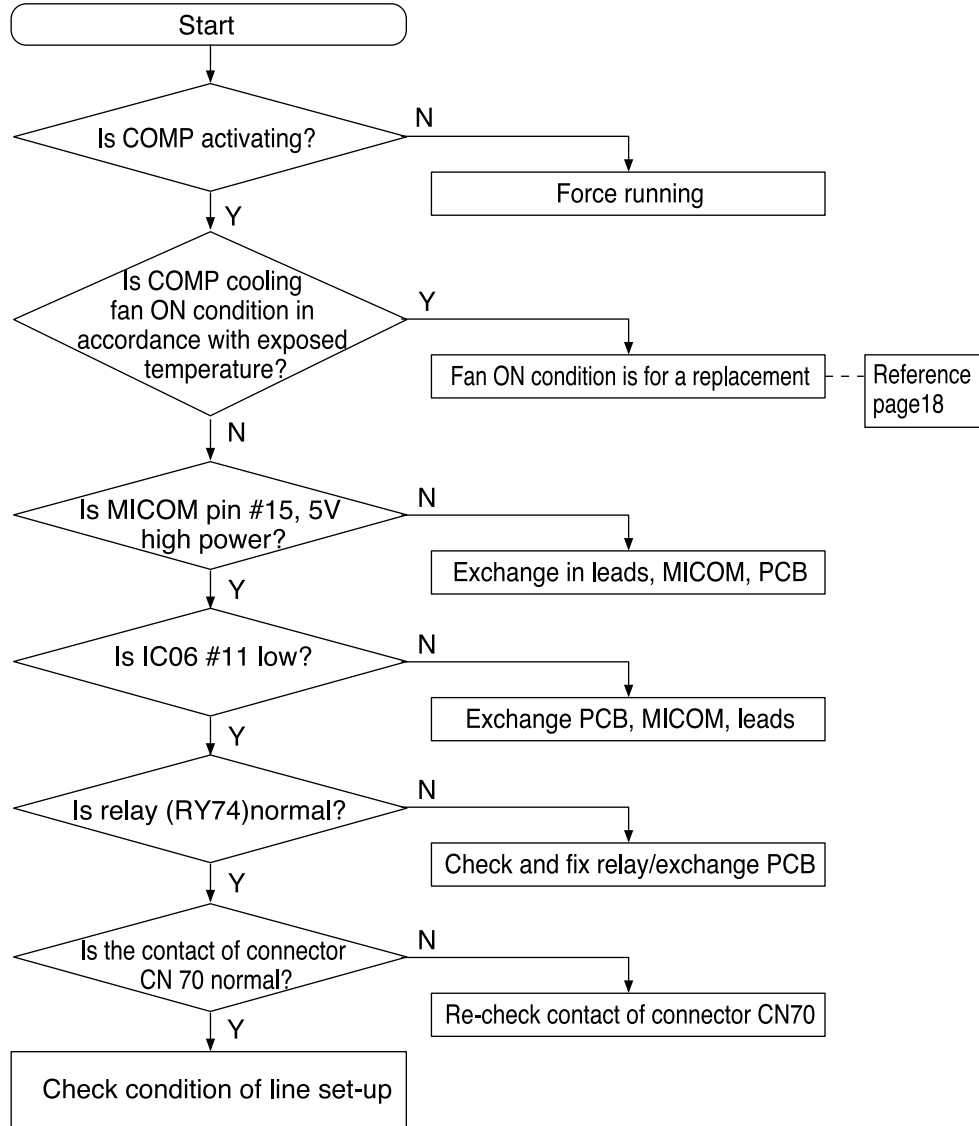

4-1) When freezer fan (f-fan) do not activate

6) When alarm run continuously

1. Alarm runs after 2 minute when door is open (melody) and runs in interval in every 2 minutes.
2. If door close is not done properly, MICOM will indicate that the door is open then alarm rings. If it recognize door open over 10 minutes it switch OFF inner lamp goes OFF. Lamp will not go ON in this situation even if door opens.

Fluorescent LAMP(SUB PCB)
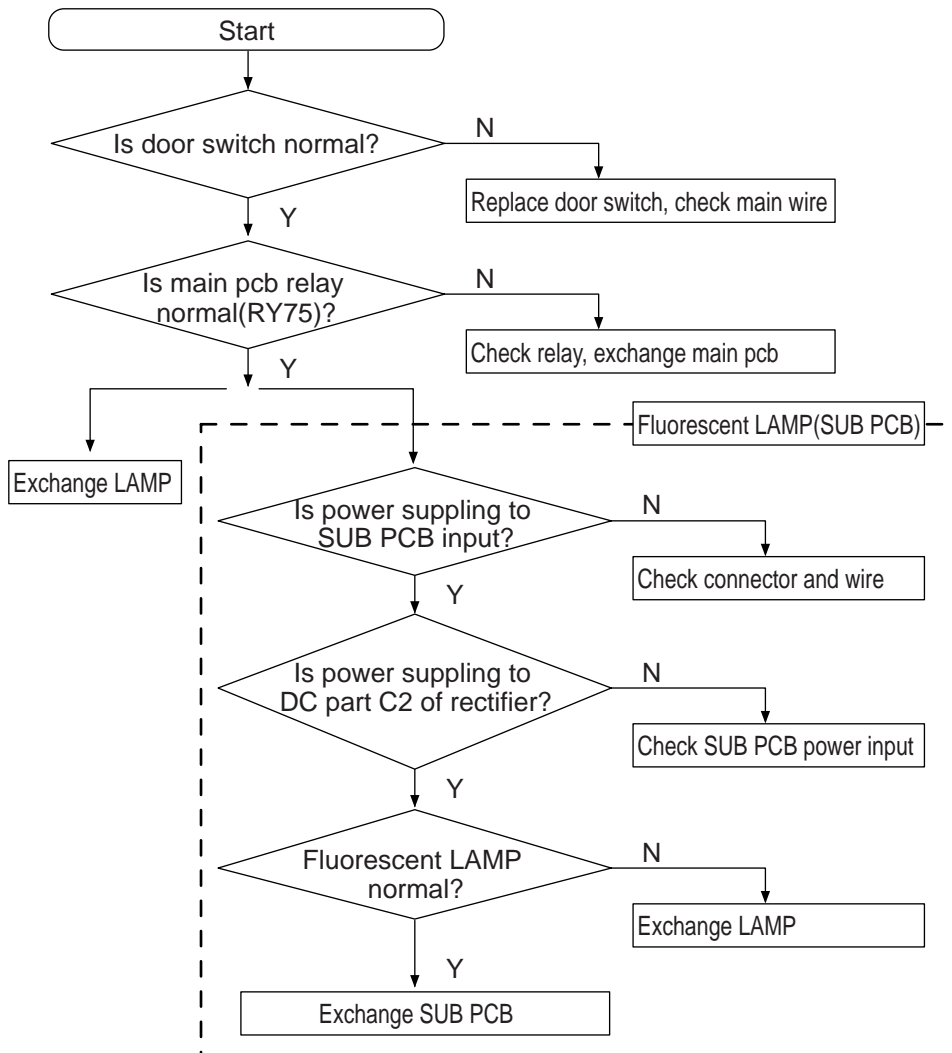

8. Reference

The connection of DOOR-CABI
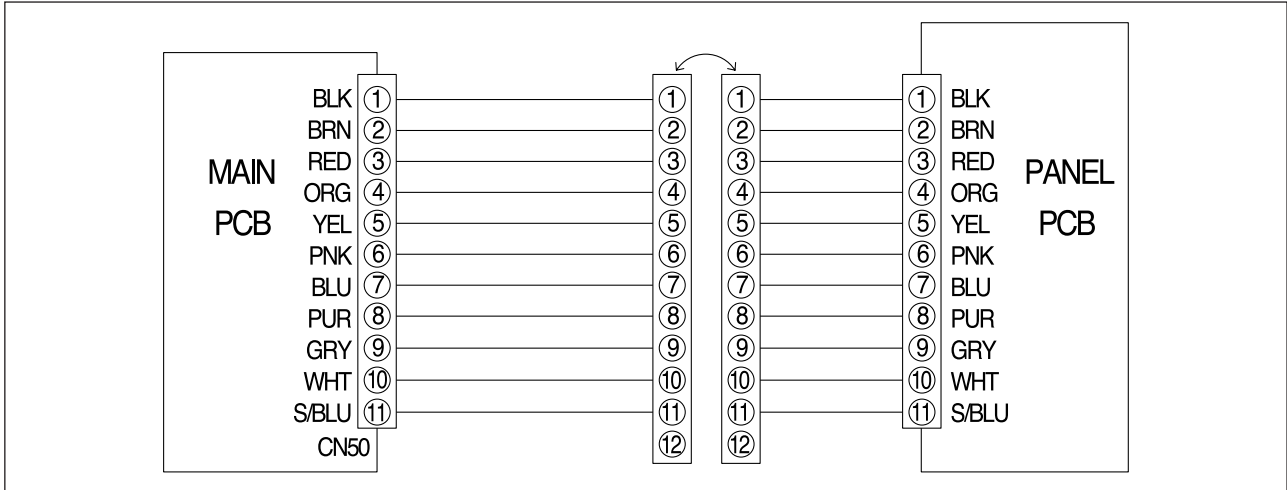

Inspection of Relay

(Relay Movement)
* First separate the housing connected to the main PCB CN70, 71 and measure the following items.

1. Measure the coil bisection of the relay and check whether it works.

2. Measure the apex bisection for open circuit.

Apex category	The voltage of coil bisection	Judging the apex bisection
Apex 3	DC 12V(Operation)	C-NO:SHORT
		C-NC:OPEN
	DC 0V(Standstill)	C-NO:OPEN
		C-NO:SHORT
Apex 2	DC 12V(Operation)	SHORT
	DC 0V(Standstill)	OPEN

Note) C → Common, NO → Normal open, NC → Normal close

3. When it operates as above, it is normal and when it does not operate, report the corresponding relay.

Reference3　Check for malfunctioning of the subordinate
* Cut off the power code, separate the housing from the main PCB CN70,71 and measure the following.

1. Measure resistance between the terminals and check for malfunctioning of L/W.

Subordinate	Measurement terminal	Evaluation of measurement result
R Defrost heater	CN70 ⑤ - ①	
F Defrost heater	CN70 ⑦ - ①	
Comp	CN70 ⑨ - ①	
Comp-circulation fan	CN71 ⑦ - ①	
R-Circulation fan	CN71 ⑤ - ①	
F-Circulation fan	CN70 ③ - ①	
R-Lamp	CN71 ⑨ - ①	
F-Lamp	CN71 ③ - ①	

Reference4　Inspection of the sensor
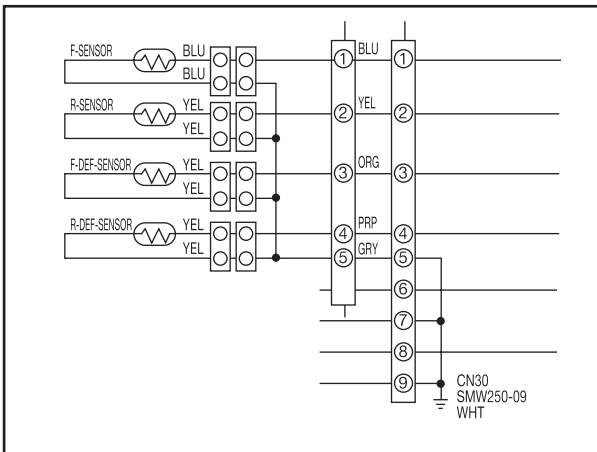

* Separate the housing connected to main PCB CN30.
* Resistance value lowers while temperature rises, because it is a NTC type sensor.

1. R sensor measures resistance of CN30 between ② ～ ⑤.
2. Freezer sensor measures resistance of CN30 between ① ～ ⑤.

3. R-defrost sensor measures resistance of CN30 between ④ ～ ⑤.
4. F-defrost sensor measures resistance CN30 between ③ ～ ⑤.
5. The measurement value above is calculated by comparing the present temperature of the sensor and the temperature table in specification found in the manual.

WHT
(Refrigerator Bulb)
1. Open the door and check if the freezer bulb turns on.
2. Press the Door S/W and check if the freezer bulb turns off.
3. Close the door of freezer and repeat 1 and 2 for refrigerator.
4. If there is a problem, check bulb and door S/W.
5. Check wire connection.

(Micom signal)
1. Check if CN30 ⑥ and ⑧ is 5V DC after closing the F·R doors.
2. Check if CN30 ⑥ is 0V DC when opening F door.
   Check if CN30 ⑧ is 0V DC when opening R door.
3. If there is problem, check door S/W and wire connection.

Forced running & forced defrosting

TEST S/W
(Forced running)

* This function is used to turn on the comp and fan immediately regardless of the temperature of freezer.

1. Press the button on the PCB after removing the main PCB cover from the upper part of refrigerator.
2. Buzzer will sound to indicate the forced running.

(Forced defrosting)

* This function is used to turn on the defrosting regardless of defrost time.

1. Press the button during forced running. Then, R-defrosting is performed.
2. If the button is press during R-defrosting, F-defrosting is also performed at the same time.
3. If the button is pressed during R-F defrosting, test mode is released.

Sensor resistance and voltage conversion table for temperature
(Sensor pressure voltage 10KΩ – Voltage converted by the F-reference)

* Voltage conversion table depends on H/W structure of MICOM port input voltage.

Sensor Short : Micom 0V.
Sensor Open : Micom 5V.

※ Sensor partial pressure resistance 10KΩ

10. Disassembly & Assembly

10-1. Replacement of refrigerator lamp

⚠️ **Warning**
Always take out the power plug when replacing the refrigerator lamp. There is the danger of electric shock.

1. Remove the cover with the back latch pressed.
2. Pull out the lamp.

3. After replacing the lamp, assemble the front latch of cover and then connect the back latch.
4. Plug in and check if power is cut off or not by pressing the R-door switch.
10-2. Replacement of refrigerator fluorescent lamp

⚠️ **Warning**
Always take out the power plug when replacing the refrigerator lamp. There is the danger of electric shock.

1. Remove a screw from the cover and pull down the cover with the back latch pressed.
2. Pull out the lamp.

3. After replacing the lamp, assemble the front latch of cover and then connect the back latch and screw on the cover.
10-3. Replacement of freezer lamp

> **Warning**
> Always take out the power plug when replacing the refrigerator lamp. There is the danger of electric shock.

1. Remove the cover by pressing the bottom latch.
2. Replace the lamp by turning it counter-clock wise.
3. Reassemble the cover in the reverse order of disassembly and plug in and the check if power is cut off by pressing the door switch.
10-4. Disassembly of the cooling cycle in the refrigeration room

1. Take out food stuffs and trays from refrigeration room.
2. Remove 4 cap screws with (–) driver or similar tools.
3. Remove 6 screws from the cover-evap. ref. assy

4. Remove 2 latches from the bottom of the cover in the front of evaporator.

5. Remove the evaporator cover by pulling out the bottom of the evaporator cover.
6. Remove the housing of wires.
■ Cooling cycle unit assembly in the refrigeration compartment

Evap. Holder

Evaparator

TEMP.FUSE

TEMP.SENSOR
■ Dust assembly in the refrigeration compartment
10-5. Disassembly of the cooling cycle unit in the freezer

1. Take out the case from the freezer.
2. Remove 2 screws from the assy-supt free.
3. Pull out the holder of the assy-supt free and disconnect wire terminals.
4. Remove the latch of the cover-evap fr. from the buttom.
5. Remove each terminal from the top of the left wire assembly.
6. Remove 2 screws from the back cover of the cooling cycle unit and remove the latch with (–) driver.

■ Assembly of the cooling cycle unit in the freezer

Temp.Fuse
Temp.Sensor
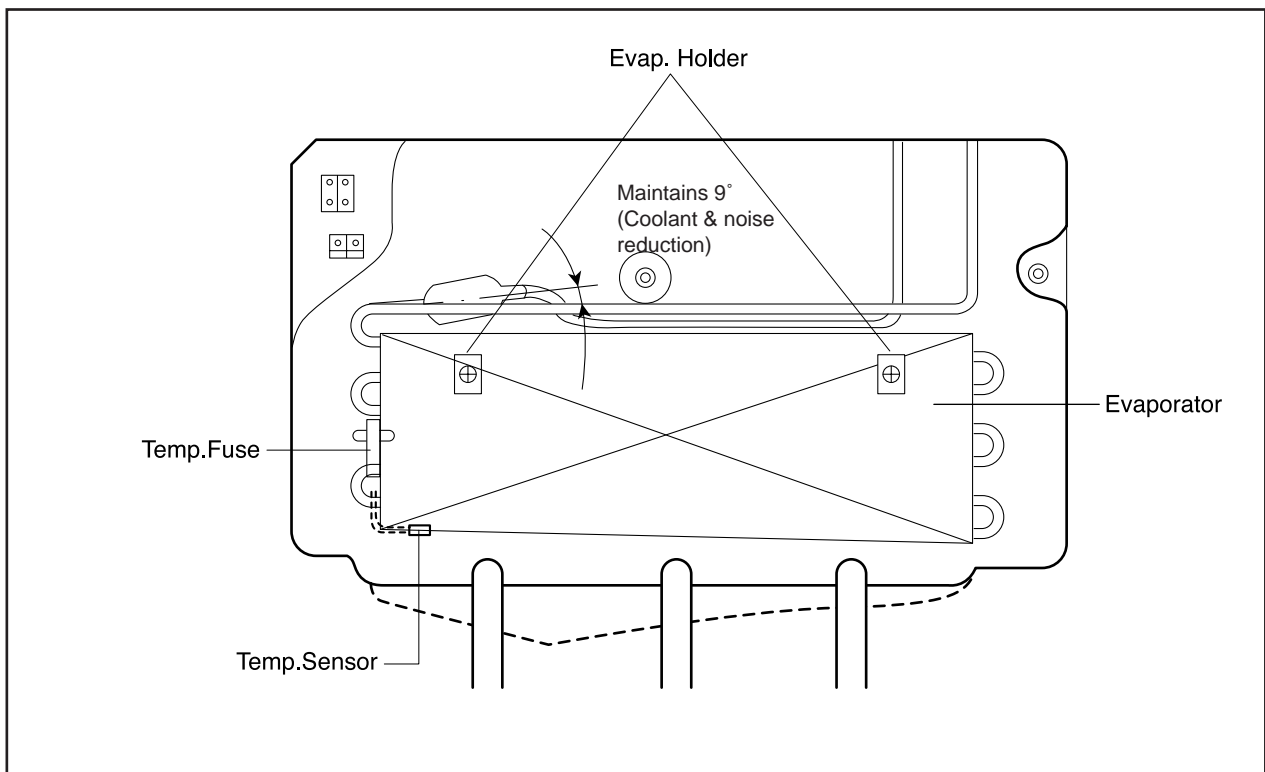

10-6. Assembly of mechanic compartment in the refrigerator

1. Remove the screws securing the mechanic compartment cover of the back bottom of the refrigerator.
2. Mechanic compartment assembly
10-7. Electric box assembly

> ⚠ **Warning**
> Make sure the power plug is taken out when replacing the components for the main PCB.

1. Disconnect the power cord.
2. Remove the cover of electrical box with (–) driver.
3. Assembly specification of electric box

TEST S/W

D/C Trans

PBA-SUB(INVERTER-PCB)
10-8. Temperature controller disassembly

1. With dispenser model.

1-1) Press the fixing lever, lift the exclusive water tank upwards, then remove it.
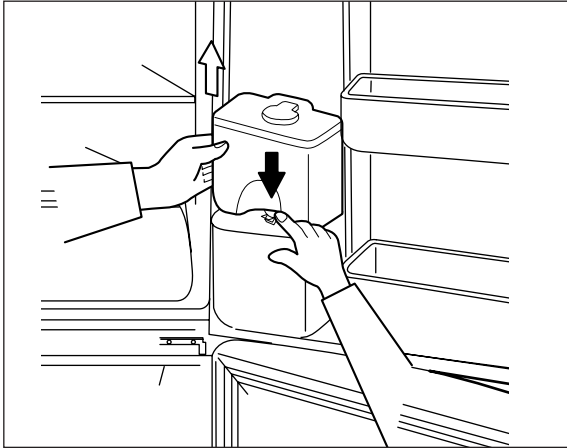

1-2) Pull out the assembly press lever.
1-3) Push the latch of control panel assembly with (-) driver and pull out the control panel
2. Without dispenser model
2-1) Remove 3 screws from the assembly control panel and pull out the assembly control panel.
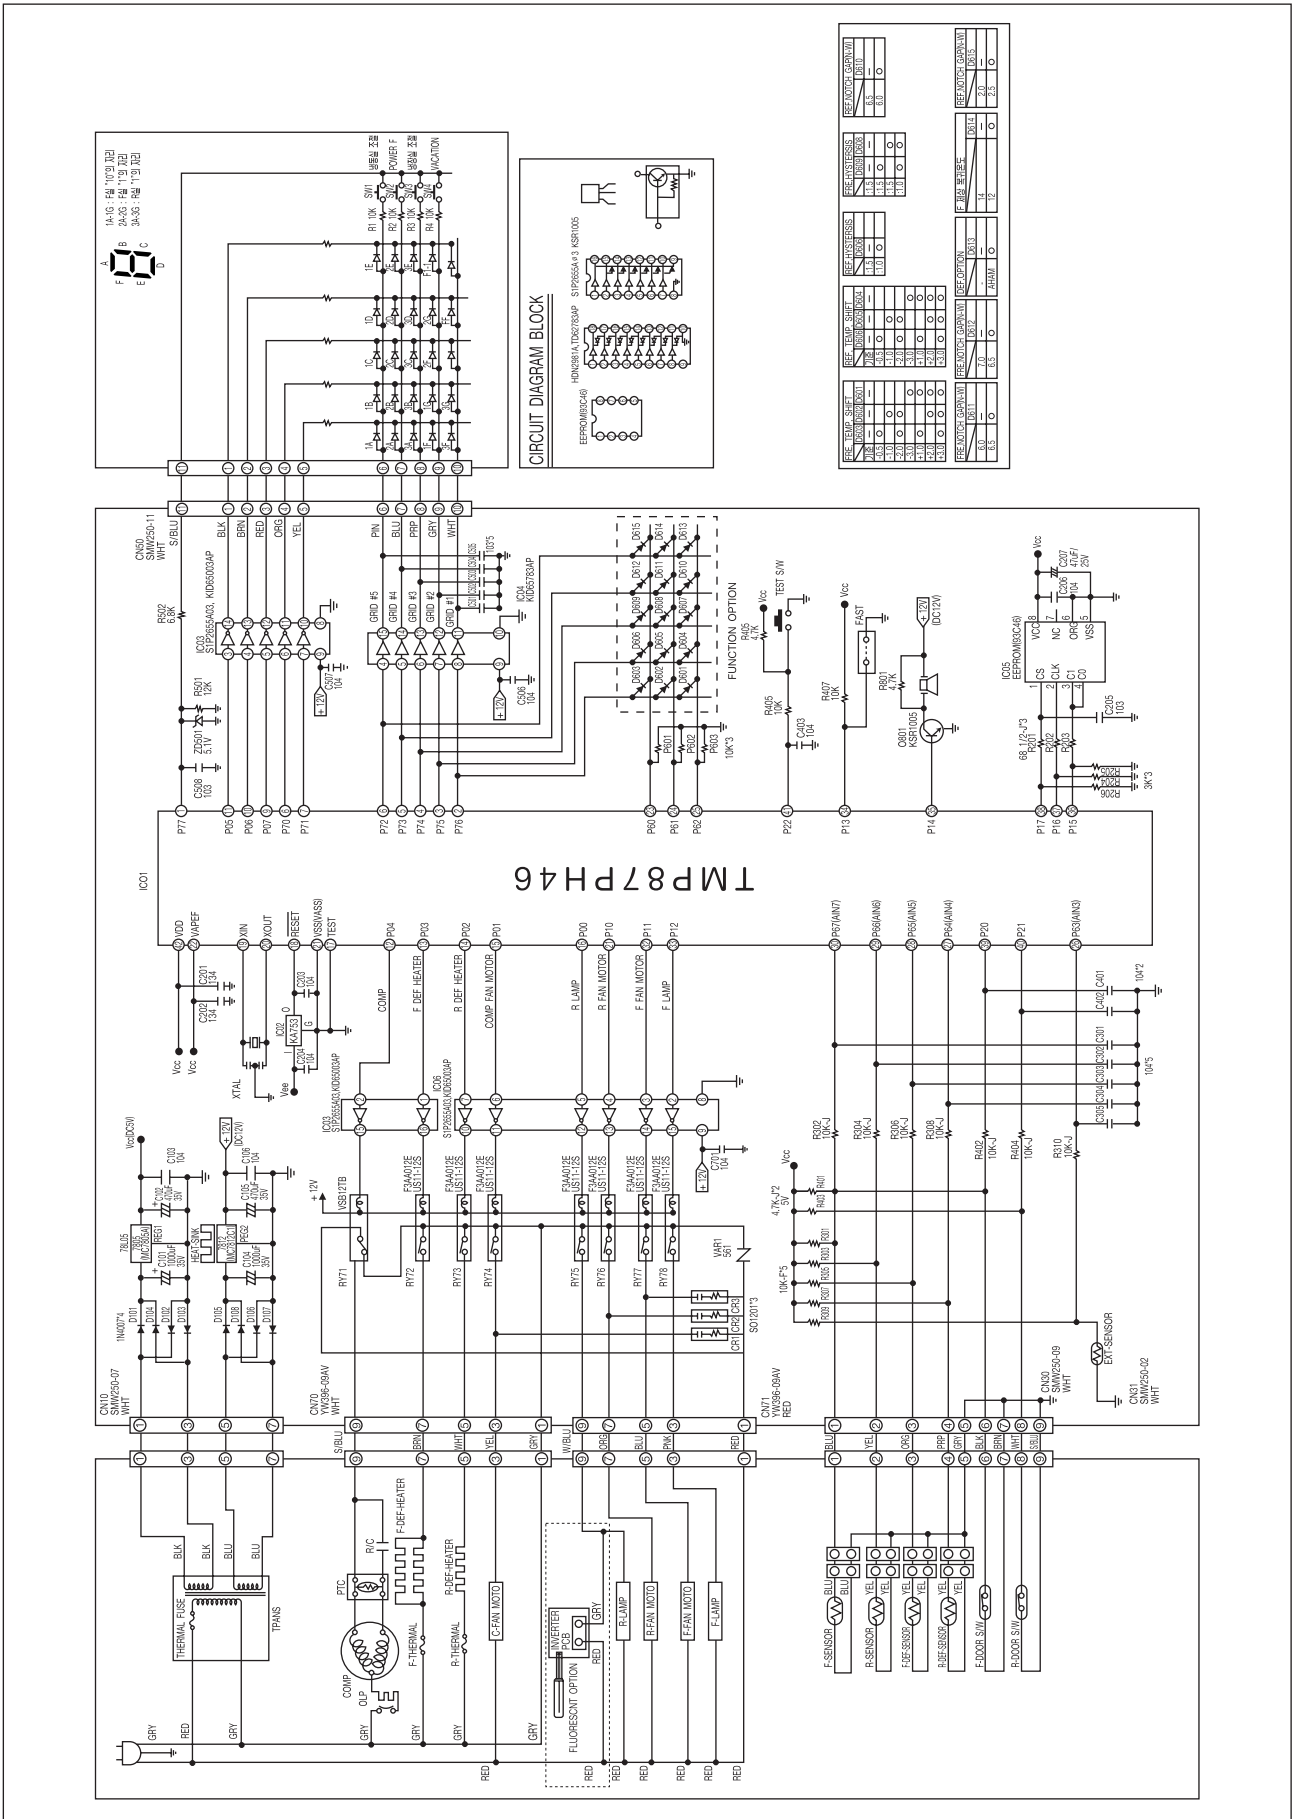

12. Specifications of main components

12-1 Regulator

3-TERMINAL 1A POSITIVE VOLTAGE REGULATORS

The MC78XX/MC78XXA series of three-terminal positive regulators are available in the TO-220 package and with several fixed output voltages, making it useful in a wide range of applications. These regulators can provide local onward regulation, eliminating the distribution problems associated with single point regulation. Each type employs internal current limiting, thermal shut-down and safe area protection, making it essentially indestructible. If adequate heat sinking is provided, they can derive over aA output current. Although designed primarily as fixed voltage regulators, these devices can be used with external components to obtain adjustable voltages and currents. MC78XXI is characterized for operation from -40°℃ to +125℃, and MC78XXC from 0℃ to +125℃.
TO-220 1 2 3 1 : Input 2 : GND 3 : Output
FEATURES

• Output Current up to 1.5A
• Output voltages of 5;6;8;9;10;11;12;15;18;24V
• Thermal Overload Protection
• Short Circuit Protection
• Output Transistor SOA Protection
• No external components required
• Output current in excess of 1A
• Industrial and commercial temperature range

* $T_{min} < T_i < T_{max}$
   MC78XXI : T_{min} = -40℃ , T_{max} = 125℃
   MC78XXC, T_{min} = 0℃ , T_{max} = 125℃
* Load and line regulation are specified at constant junction temperature. Changes in V_o due to heating effects must be taken into account separately. Pulse testing with low duty is used.

FAIRCHILD

SEMICONDUCTOR®

KA78LXXA/KA78L05AA
3-Terminal 0.1A Positive Voltage Regulator

Features

• Maximum Output Current of 100mA
• Output Voltage of 5V, 6V, 8V, 9V,10V, 12V, 15V, 18V and 24V
• Thermal Overload Protection
• Short Circuit Current Limiting
• Output Voltage Offered in ± 5% Tolerance

Description

The KA78LXXA/KA78L05AA series of fixed voltage monolithic integrated circuit voltage regulators are suitable for application that required supply current up to 100mA.

  – 2.7 (V_{CC} = 2.7V to 5.5V)
  – 2.5 (V_{CC} = 2.5V to 5.5V)
  – 1.8 (V_{CC} = 1.8V to 5.5V)
▫ **User-selectable Internal Organization**
  – 1K: 128 x 8 or 64 x 16
  – 2K: 256 x 8 or 128 x 16
  – 4K: 512 x 8 or 256 x 16
▫ **3-wire Serial Interface**
▫ **2 MHz Clock Rate (5V) Compatibility**
▫ **Self-timed Write Cycle (10 ms max)**
▫ **High Reliability**
  – Endurance: 1 Million Write Cycles
  – Data Retention: 100 Years
  – ESD Protection: >4000V
▫ **Automotive Grade and Extended Temperature Devices Available**
▫ **8-pin PDIP, 8-lead JEDEC and EIAJ SOIC, and 8-lead TSSOP Packages**

Description

The AT93C46/56/57/66 provides 1024/2048/4096 bits of serial electrically erasable programmable read only memory (EEPROM) organized as 64/128/256 words of 16 bits each, when the ORG pin is connected to V_{CC} and 128/256/512 words of 8 bits each when it is tied to ground. The device is optimized for use in many industrial and commercial applications where low power and low voltage operations are essential. The AT93C46/56/57/66 is available in space saving 8-pin PDIP and 8-lead JEDEC and EIAJ SOIC packages.

AT93C46

AT93C56

AT93C57

AT93C66

The AT93C46/56/57/66 is enabled through the Chip Select pin (CS), and accessed via a 3-wire serial interface consisting of Data Input (DI), Data Output (DO), and Shift Clock (SK). Upon receiving a READ instruction at DI, the address is decoded and the data is clocked out serially on the data output pin DO. The WRITE cycle is completely self-timed and no separate ERASE cycle is required before WRITE. The WRITE cycle is only enabled when the part is in the ERASE/WRITE ENABLE state. When CS is brought "high" following the initiation of a WRITE cycle, the DO pin outputs the READY/BUSY status of the part.

The AT93C46 is available in 4.5V to 5.5V, 2.7V to 5.5V, 2.5V to 5.5V, and 1.8V to 5.5V versions. The AT93C56/57/66 is available in 4.5V to 5.5V, 2.7V to 5.5V, and 2.5V to 5.5V versions.

Absolute Maximum Ratings*

Operating Temperature .... -55°C to +125°C
Storage Temperature .... -65°C to +150°C
Voltage on Any Pin with Respect to Ground .... -1.0V to +7.0V
Maximum Operating Voltage 6.25V
DC Output Current .... 5.0 mA

*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability

Block Diagram
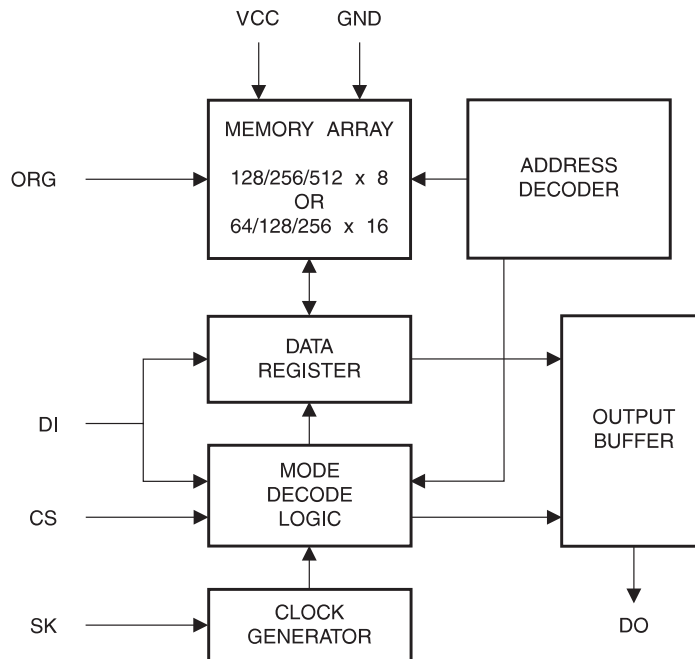

Note: 1.   When the ORG pin is connected to V_{CC}, the x 16 organization is selected. When it is connected to ground, the x 8 organization is selected. If the ORG pin is left unconnected, then an internal pullup device (of approximately 1 M) will select the x 16 organization. This feature is not available on 1.8V devices.

Pin Capacitance[1]

Applicable over recommended operating range from T_A = 25°C, f = 1.0 MHz, V_{CC} = +5.0V (unless otherwise noted).

Symbol	Test Conditions	Max	Units	Conditions
C_{OUT}	Output Capacitance (DO)	5	pF	V_{OUT} = 0V
C_{IN}	Input Capacitance (CS, SK, DI)	5	pF	V_{IN} = 0V

Note: 1. This parameter is characterized and is not 100% tested.

DC Characteristics

Applicable over recommended operating range from: T_{AI} = -40°C to +85°C, V_{CC} = +1.8V to +5.5V,
T_{AC} = 0°C to +70°C, V_{CC} = +1.8V to +5.5V (unless otherwise noted).

Symbol	Parameter	Test Condition		Min	Typ	Max	Unit
V_{CC1}	Supply Voltage			1.8		5.5	V
V_{CC2}	Supply Voltage			2.5		5.5	V
V_{CC3}	Supply Voltage			2.7		5.5	V
V_{CC4}	Supply Voltage			4.5		5.5	V
I_{CC}	Supply Current	V_{CC} = 5.0V	READ at 1.0 MHz		0.5	2.0	mA
			WRITE at 1.0 MHz		0.5	2.0	mA
I_{SB1}	Standby Current	V_{CC} = 1.8V	CS = 0V		0	0.1	µA

7CH DARLINGTON SINK DRIVER

The TD62001P / AP / F / AF Series are high-voltage, high-current darlington drivers comprised of seven NPN darlington pairs.

All units feature integral clamp diodes for switching inductive loads.

Applications include relay, hammer, lamp and display (LED) drivers.

FEATURES

● Output current (single output) 500mA MAX.

● High sustaining voltage output
35V MIN. (TD62001P / F Series)
50V MIN. (TD62001AP / AF Series)

● Output clamp diodes

● Inputs compatible with various types of logic

● Package Type-P, AP : DIP-16pin

● Package Type-F, AF : SOP-16pin

8CH HIGH-VOLTAGE SOURCE DRIVER

The TD62783AP / F / AF Series are comprised of eight source current Transistor Array.

These drivers are specifically designed for fluorescent display applications.

Applications include relay, hammer and lamp drivers.

FEATURES

- High output voltage Type-AP, AF : $V_{CC} = 50V$ MIN.
  Type-F : $V_{CC} = 35V$ MIN.

- Output current (single output) $I_{OUT} = -500mA$ MIN.

- Output clamp diodes

- Single supply voltage

- Input compatible with various types of logic

- Package Type-AP : DIP-18pin

- Package Type-F, AF : SOP-18pin
